

FOXBOT

Deploy multiple automated employees simultaneously to execute your Foxtrot scripts

FoxBot

FoxBots are the newest addition to the Foxtrot Robotic Process Automation Software Suite and they enable financial institutions, healthcare and other organizations to deploy “automated employees” in an efficient and cost effective way executing multiple instances of Foxtrot RPA scripts to complete automation projects even more quickly.

1. Open The Program
2. Search for Active FSPs
3. Join The Project

How It Works

Easy to Use	Like Foxtrot Enterprise, users of FoxBots don't need coding experience to join a project. Just open the program, search active FSPs and join the project.
Complete Large Tasks	Just as a group of employees work together to finish a project, FoxBots team up to quickly and efficiently complete large projects.
Works with Your Core System	FoxBots input data into your core business system, and Foxtrot RPA preserves business rules, data validations and formatting while preserving core audit trails.
Automate Processes to Save Time	In conjunction with Foxtrot Enterprise, which provides capabilities to author and build scripts, FoxBots enable operations team members to quickly and efficiently execute conversions, mass updates, data mining, integrations and other tasks.
Centralizes Results	Once FoxBot has completed a project, all results are located within a central file. The user does not have to pull information from each computer.

Cost Efficient

FoxBot allows organizations to boost operational efficiency at a fraction of the cost of additional Foxtrot Enterprise licenses or adding staff.

No Down Time

If a critical error occurs, the operations team can focus on resolving the problem while the other FoxBots continue working.

World Class Support

You receive the same world class US-based support for FoxBots that you've come to expect from us.
